Sprint 1 Goal - RECAP

- Project setup (Ci-Pipelines, Sonar, Quality Gates, Websockets, Docker, Database, UML, User Stories, UI Sketches...)
- Basic game loop
 - Game Initialization (minimal)
 - Dice Roll
 - Coin Gain
 - Buy Card
 - Turn Handling

Initial Sprint 2 Goal

- Core game loop:
 - Turn handling
 - Dice roll
 - Basic coin calculation
 - Card purchase (simplified rules)
- Backend:
 - Game state management
 - Turn validation
 - State updates
- WebSocket:
 - Real-time synchronization of game state
 - Broadcasting actions to all players
- Client:
 - Display game state (dice, coins, cards, active player)
 - Allow user interaction for core actions
- UI:
 - Minimal functional screens (not polished)
- Implement network communication between at least two players
- Support game state recovery after player disconnection/reconnection
- Support game state recovery after backend container failure or restart
- Implement a health check endpoint
- Automatically build the backend as a container and deploy it to the university server
- Create documentation with a focus on the network protocol

What was achieved in Sprint 2

- Core game loop:
 - Turn handling
 - Dice roll
 - Basic coin calculation
 - Card purchase (simplified rules)
- Backend:
 - Game state management
 - Turn validation
 - State updates
- WebSocket:
 - Backend real-time synchronization and broadcasts implemented
 - Client integration partially implemented
 - Remaining: full state updates from broadcasts, turn-flow actions, and two-player sync verification
- Client:
 - Display game state (dice, coins, cards, active player)
 - Allow user interaction for core actions
- UI:
 - Minimal functional screens (not polished)
- Implement network communication between at least two players
- Support game state recovery after player disconnection/reconnection
- Support game state recovery after backend container failure or restart
- Implement a health check endpoint
- Automatically build the backend as a container and deploy it to the university server
- Create documentation with a focus on the network protocol

How will we tackle the challenges now

- Game initialization & navigation was done last so:
 - Apply fix for specific bug (that is found when running the game)
 - Check the status
 - Address the next bug ...

Polish what already implemented and adapt if needed

Working Demo
