

Sub-Issue Creation Guide

Goal

Break down large feature issues into **small, clear implementation tasks** that can be developed in separate PRs.

Rules

- One sub-issue = **one implementation step (1 PR)**
- Should be doable in **1–2 days**
- Must be **testable independently**
- Keep issues **focused** (don't mix backend + client)
- Group small related tasks if needed

Avoid

- Issues that are too big (e.g. “Implement game logic”)
- Issues that are too small (e.g. “Add button click”)
- Mixing backend + client in one issue
- Skipping Definition of Done

Required Structure (description)

Each issue must contain:

Goal

Short description of what this issue achieves.

Tasks

- [] *Clear implementation step*

- [] *Additional steps if needed*

Definition of Done

- [] *Feature works as expected*

- [] *No crashes / edge cases handled*

- [] *Tested manually (or unit test if applicable)*

- [] *Works with WebSocket (if relevant)*

- [] *Works in Docker environment*

- [] *PR created and CI passes*

Related issues / waiting on / depends on

#xx #yy

 Add **specific DoDs** if needed.

Size Rule

- One issue = one PR
- Max ~200–300 lines of change
- If bigger → **split it**

Example (Dice Roll)

- Backend: generate dice result
- Backend: validate turn
- WebSocket: send result
- Client: display result

 Each can be its own sub-issue

Additional Note / Rules

- Creating sub-issues does NOT mean you implement all of them
